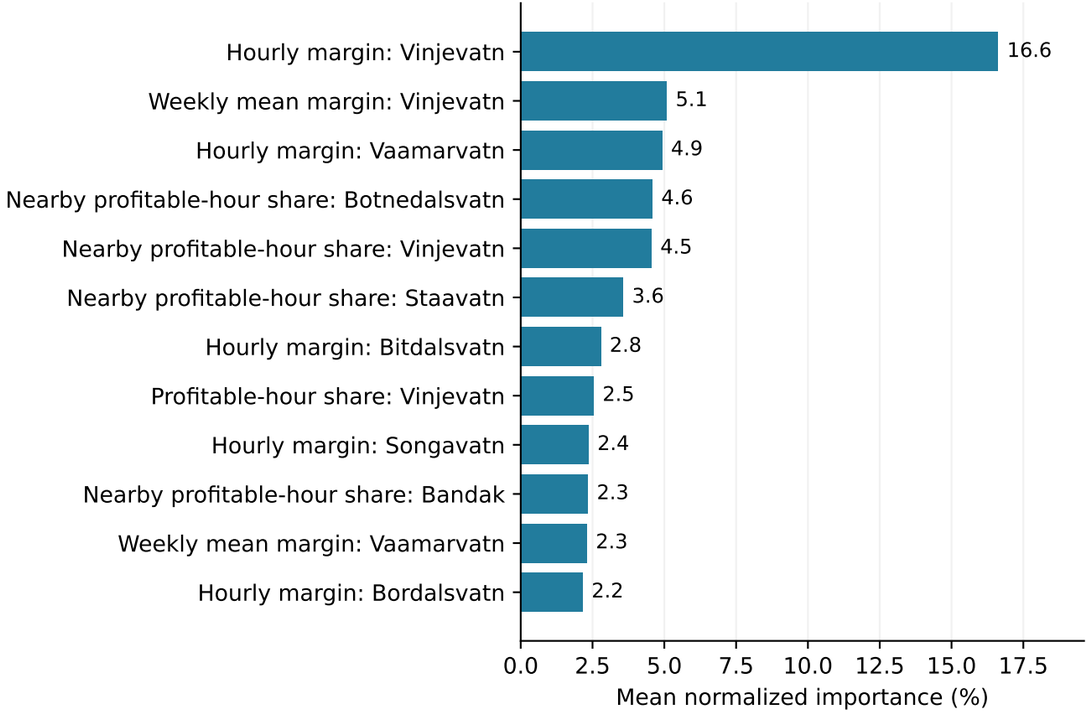
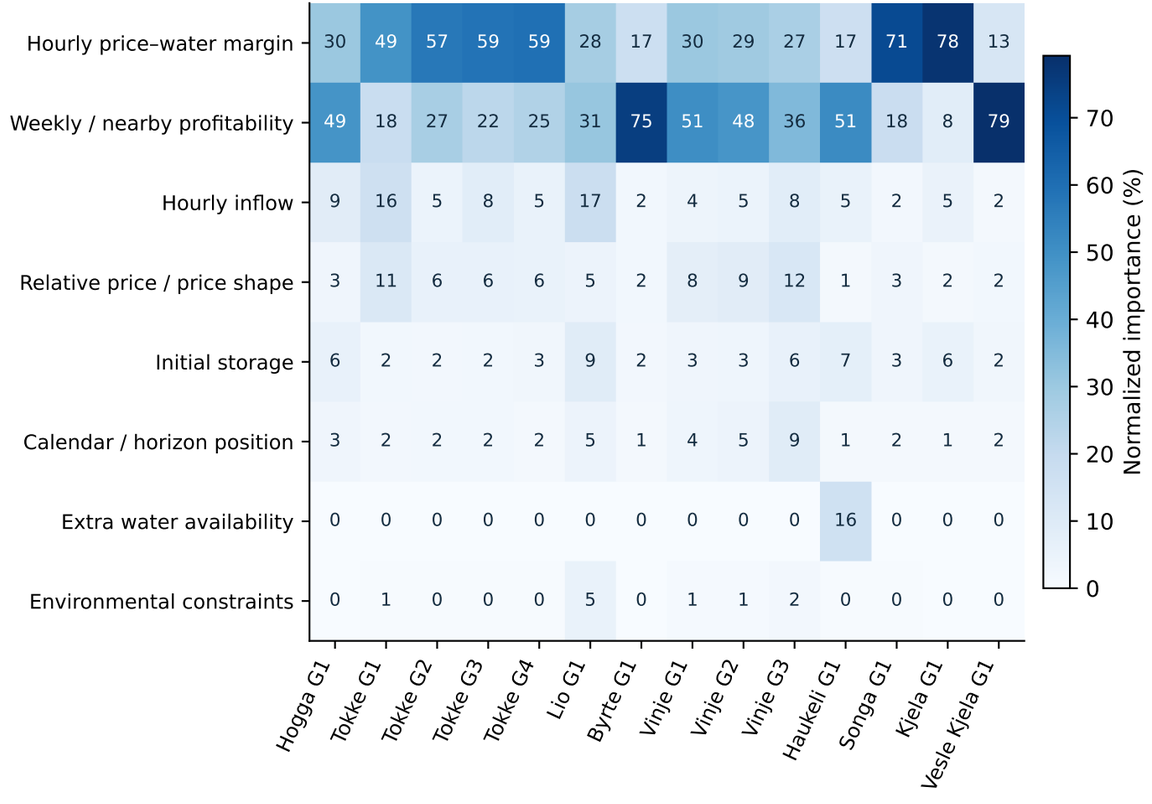
# Random forest interpretation: final model configuration

Impurity-based importance · fitted on all labeled 2015–2022 cases

## (a) Leading individual features



## (b) Feature groups by generating unit



Panel (a): equal-weight mean across 14 units; unused features contribute zero. Panel (b): sum within each feature group.
Lio combines both forests with equal weights. Importances describe tree splits; they do not show effect direction or causality.
